TFL Eco Guidelines, Part 3 – restricted substances

TFL have published the latest edition of their TFL Eco Guidelines. This publication is the third in series that TFL are preparing in order to enhance the understanding of ecological aspects in leather manufacturing.

The tanning industry must comply with a rapidly increasing set of regulations and commercial specifications, which restrict the use of chemical substances considered to have hazardous or toxic properties. The issue 'Restricted substances in leather' presents the topic in a clear and easy to understand manner for people working in tanneries and the leather industry.

TFL say that the brochure is customised to the particular requirements of their direct customers and is very useful for the whole leather processing industry.

The TFL Eco Guidelines brochure is now available.
